

Embedding your CareCredit financing page

Adding CareCredit to your website is easy! Follow the steps below to add your custom financing page to your website. These steps may vary depending on which website editor you’re using. If you need more detailed help, check out the additional resources section below or visit your website editor’s support center.

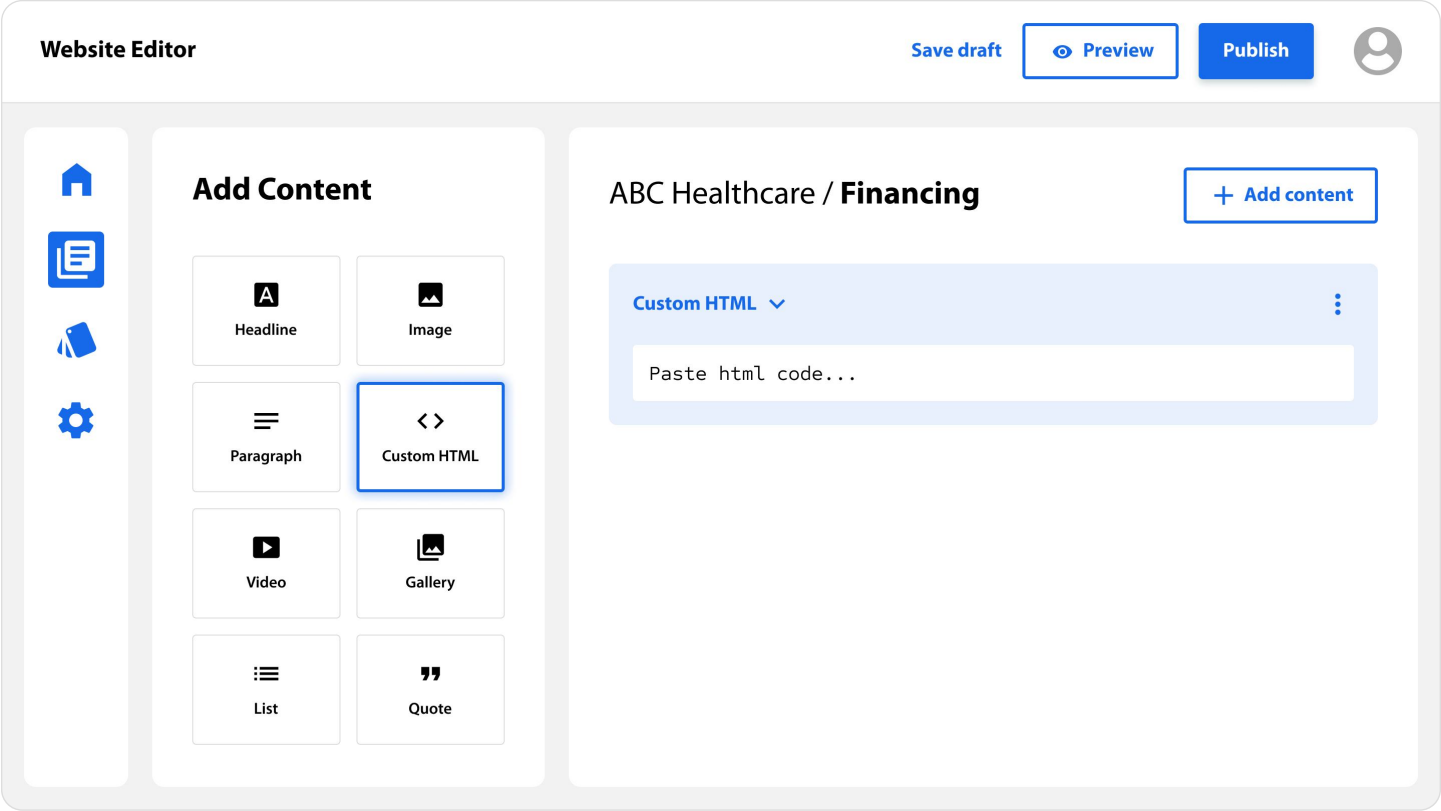

1 Add a new page to your website

Once logged into your website editor, locate the **Pages** section on your dashboard and **create a new page**. For the best experience, we recommend setting up a dedicated page for your customized CareCredit financing page. Give the new page a title like **“Financing”** or something similar that feels right for your practice.

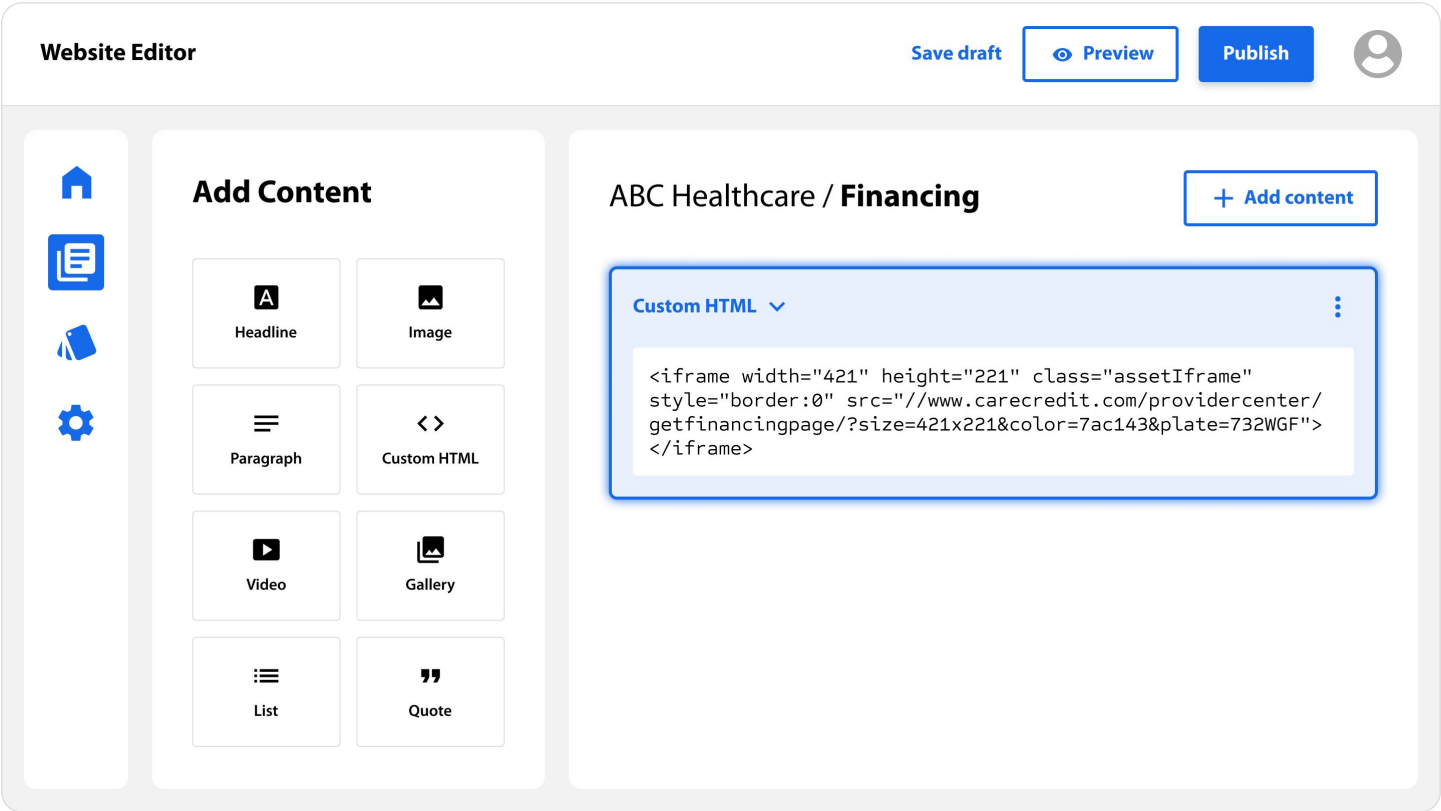

2 Add HTML code content block

On your new page, look for the option to **add content**. You’ll want to choose the option labeled **HTML**, **Embed Code**, or **Custom HTML** – the wording may vary depending on your website editor. Once selected, a content block will appear where you can paste your HTML code.

3 Paste your HTML code into content block

Paste your custom code into the HTML content block. Avoid making any changes to the code – editing it could cause errors or prevent the page from working properly.

Preview your new financing page to make sure everything looks right. If it does, save your changes and click **Publish** when you're ready to make the page live.

Additional resources

Depending on which website editor you’re using for your practice’s site, the steps might look a little different. To make things easier, we’ve linked to help articles from some of the most popular editors that show you how to add HTML to your site.
